

LG Pilates Booking System

Improvement Recommendations — what else could help, beyond what's already on the backlog
Compiled 6 Jul 2026 · For Mark's review · No code changed to produce this report

What this is: after the recent round of security and code reviews, this report looks forward — new features, admin conveniences, compliance gaps, UX polish, and behind-the-scenes engineering items that haven't come up before. Nothing here needs doing before launch. It's a menu for after launch, so nothing gets forgotten.

How to read it: each item says what it is, why it matters, a real scenario where it would have helped, and a rough impact/effort rating. None of these duplicate existing backlog issues — where something overlaps, it says so.

Top 5 priorities (highest impact for the effort)

- 1. **Client-side error monitoring (#15)** — right now nobody finds out when the site breaks for a customer until Louise notices bookings have dried up. Small effort, big blind spot closed.
- 2. **Automated off-site backups (#16)** — today's "backup" is a manual CSV download. If the Supabase project were ever lost, there's no tested way back.
- 3. **GDPR posture for health data (#10)** — PAR-Q medical answers are kept forever with no retention policy or erasure path. This is the one compliance gap worth fixing before real customer volume grows.
- 4. **Automated reminder emails (#3)** — cuts down Louise having to personally chase people, using tools already installed (pg_cron, typed email sends).
- 5. **Customer self-service via magic link (#1)** — the single biggest reduction in "email Louise to change anything." Bigger job, phase it (view-only first).

Impact / effort matrix

#	Recommendation	Impact	Effort	Section
1	Customer self-service via magic link	High	L	A
2	Add-to-calendar (.ics) in confirmation emails	Med	S	A
3	Automated reminder emails	High	M	A
4	One-click rebooking / renewal link	Med	M	A
5	Customer notes	Med	S	B
6	Digital attendance / no-show tracking	Med	M	B
7	Admin audit log	Med	M	B
8	Bulk actions + richer table filters	Med	M	B
9	Calendar / agenda view for admin	Med	M	B

10	GDPR posture for health data	High	M	C
11	Terms & conditions acceptance record	Med	S	C
12	Accessibility pass	Med	M	D
13	User-facing error states	Med	S	D
14	Public schedule niceties	Low	S	D
15	Client-side error monitoring	High	S	E
16	Automated off-site backups	High	M	E
17	Supply-chain + CI hardening	Med	S	E
18	Uptime monitoring	Med	S	E
19	Security headers at Netlify migration	Med	S	E
20	Refactor path beyond file split	Med	L	E

A. New features — customer-facing

1. Customer self-service via magic link

High impact

Large effort

What: a "Manage my booking" link in the confirmation email opens a page where the customer can see their booking, sessions remaining, and cancel themselves — no login/password, just a secure link tied to their booking.

Why it matters: today a customer can do nothing after booking. Every change — even just checking how many sessions are left — means emailing Louise.

Scenario: a customer wants to check if they've got 2 or 3 sessions left before deciding whether to rebook. Today: email Louise, wait for a reply. With this: they click the link in their own confirmation email and see it instantly.

Suggested phasing: ship a view-only version first (see booking + sessions remaining), add self-cancel later once the view-only version has proven itself.

2. Add-to-calendar (.ics) in confirmation emails

Medium impact

Small effort

What: attach a calendar file to the confirmation email so all of a customer's session dates drop straight into their phone's calendar in one tap.

Why it matters: customers currently have to manually note down (or forget) every session date in a block.

Scenario: a customer books an 8-week block. Instead of writing down 8 Monday evenings, they tap "Add to calendar" once and all 8 are in.

3. Automated reminder emails

High impact

Medium effort

What: an automatic "your block starts Monday" email before the first session, and optionally a "3 sessions left — here's how to rebook" nudge near the end of a block (ties into the existing priority-window logic).

Why it matters: reduces no-shows on the first week, and reduces Louise having to personally chase renewals. The infrastructure (pg_cron, typed email sending) is already in place from session 68's work — this is mostly wiring, not new plumbing.

Scenario: someone books 3 weeks in advance, forgets, and no-shows week one. A reminder the day before would have caught it.

4. One-click rebooking / renewal link

Medium impact

Medium effort

What: email existing customers a prefilled link for the next block in their usual class, so renewing is one click instead of starting the booking flow from scratch.

Why it matters: complements the waitlist and priority-window features already planned — reduces the manual chasing Louise does at the end of every block.

Scenario: a regular Monday customer's block is ending. Instead of Louise messaging them to ask if they want to rebook, they get an email with a single "rebook now" button.

B. New features — admin / Louise

5. Customer notes

Medium impact

Small effort

What: a free-text notes field on each customer record — injuries, preferences, "prefers front row", etc.

Why it matters: there's currently nowhere to record this. Only catch-up swaps have a notes field; ordinary customers don't.

Scenario: Louise remembers a customer has a bad knee but has no way to flag it on their record for next time she's planning the class.

6. Digital attendance / no-show tracking

Medium impact

Medium effort

What: tick attendance per session in the dashboard, feeding no-show stats into Reports. This is the "v2" of the already-backlogged printable attendance register (issue #10) — same need, digital instead of paper.

Wireframe — attendance tick-list (illustrative only)

Monday 6pm — Beginners — 9 Jun session

☒ Jane Smith

☒ Priya Patel

☐ Tom O'Neill (not yet marked)

☐ Amy Clark — no-show

7. Admin audit log

Medium impact

Small-medium effort

What: a record of who changed or deleted what, and when. One new `audit_log` table, with an entry written inside the existing admin delete/edit database functions.

Why it matters: all admin deletes today are permanent, with no trail. If a customer or block is deleted by mistake, there's no way to see it happened or undo it.

Scenario: a customer record vanishes and nobody remembers deleting it. An audit log would show exactly when and by whom.

8. Bulk actions + richer table filters

Medium impact

Medium effort

What: confirm several reserved bookings at once; filter the bookings table by status/venue/date, not just free-text search.

Scenario: after a busy weekend, Louise has 12 bank-transfer bookings to confirm one by one. Bulk-confirm would do it in one action.

9. Calendar / agenda view for admin

Medium impact

Medium effort

What: a week view showing all classes with their fill levels at a glance. Today the dashboard only offers list/accordion views.

Wireframe — admin week view (illustrative only)

Mon	Tue	Wed	Thu	Fri
6pm Beginners 7/8	10am Improvers 9/10		6pm Adv FULL 10/10	

C. Compliance / data protection

This section is the "didn't know about" flagship of the report — nothing here is on the existing backlog.

10. GDPR posture for health data

High impact**Medium effort**

What: PAR-Q medical answers are currently stored indefinitely, with no retention policy, no record of when someone accepted the terms, no marketing-consent flag, and no self-service way for a customer to ask for their data to be deleted (`deleteCustomer` exists but is an admin-only hard delete, not a customer-facing "erase me" option).

Why it matters: UK GDPR treats health data as a "special category" needing extra care. Recommended fixes: a retention policy (e.g. auto-anonymise PAR-Q answers some months after a customer's last booking, using the `pg_cron` job already installed), a consent checkbox + timestamp captured at booking time, and a link to a privacy policy.

Scenario: a former customer emails asking "please delete everything you hold on me." Today there's no clean process to point to.

11. Terms & conditions acceptance record

Medium impact**Small effort**

What: the PAR-Q declaration is signed in the booking form, but there's no stored, versioned record of which terms text a customer agreed to and when.

Scenario: a dispute arises over what a customer was told about cancellation policy at the time they booked — there's currently no record to check against.

D. UX / UI polish

12. Accessibility pass

Medium impact

Medium effort

What: form labels aren't properly linked to their fields, validation errors aren't announced to screen readers, errors are visual-only, and there's no tested keyboard-only flow.

Why it matters: this is a health/fitness booking site — accessibility matters more here than average, and some of these are simple fixes.

13. User-facing error states

Medium impact

Small effort

What: many data loads that fail today just log to the browser console — the customer or admin just sees a table stuck on "Loading..." forever with no explanation.

Why it matters: complements issue #51 (fixed session 70), which handled the write side (failed saves showing false success). This is the matching read-side fix — add a visible "couldn't load — retry" state.

14. Public schedule niceties

Low impact

Small effort

What: small polish on the public schedule — "Starts in 3 days" on class cards, clearer FULL/spaces-remaining states ahead of the waitlist launch, links to a map for each venue.

E. Engineering / operations

Invisible to customers, but the kind of thing that prevents a bad day later.

15. Client-side error monitoring

High impact**Small effort**

What: there is currently zero visibility of JavaScript errors happening in real customers' browsers. A free tier of an error-monitoring tool (e.g. Sentry) would alert when customers are hitting errors.

Scenario: the Stripe redirect silently breaks for one browser type. Today, nobody finds out until Louise notices bookings have quietly stopped coming in.

16. Automated off-site backups

High impact**Small-medium effort**

What: today's Backup dashboard page is a manual CSV download with no tested restore path.
Recommendation: a scheduled database dump via a GitHub Action to private storage, or upgrade to Supabase's Pro-tier point-in-time recovery (ties into the existing Supabase Pro decision, issue #19) — with an actual restore drill to prove it works.

Scenario: the Supabase project is accidentally deleted or corrupted. Today, the most recent restore point is whenever someone last remembered to click "download CSV."

17. Supply-chain + CI hardening

Medium impact**Small effort**

What: no Dependabot, no `npm audit` in CI, no CodeQL scanning; the test suite only runs in Chromium, with no accessibility (axe) or performance (Lighthouse) checks. These are all cheap additions to the existing GitHub Actions config.

18. Uptime monitoring

Medium impact**Small effort**

What: a free external pinger (e.g. UptimeRobot) watching the live site plus a simple Supabase health check, alerting Louise or Mark the moment the site goes down instead of waiting for a customer to mention it.

19. Security headers at Netlify migration

Medium impact

Small effort

What: GitHub Pages can't set custom security headers (like a Content-Security- Policy); Netlify's `_headers` file can. Best done at the same time as the planned Netlify move (release Phase 1.5, issue #65) rather than as separate work — flagging it now so it lands on that phase's checklist.

Cross-ref: release Phase 1.5 (#65).

20. Refactor path beyond the file split

Medium impact

Large effort

What: building on the already-backlogged split of `index.html` into separate files (issue #18) — while that's happening, also worth killing the duplicated PAR-Q label lists, merging the duplicated block-date math (`calcBlockDates/calcProrata`), and breaking up long functions like `confirmBooking` (~180 lines).

Cross-ref: file split (#18) — present this as "do when #18 happens," not standalone work.

Appendix — cross-reference with existing backlog

None of the 20 recommendations above duplicate an already-open issue. Where a recommendation builds on or should be timed with existing work, that's noted below.

New recommendation	Related existing issue	Relationship
#6 Digital attendance / no-show tracking	#10 Printable attendance register	"v2" — digital version of the same underlying need
#14 Public schedule niceties	#71–76 Waitlist feature	Complements the FULL/spaces-remaining display work already planned for waitlist
#19 Security headers at Netlify migration	#65 Release Phase 1.5	Should be done in the same phase, not separately
#20 Refactor path beyond file split	#18 Split index.html	Extends the same piece of work — do together
#16 Automated off-site backups	#19 Supabase Pro tier decision	Pro-tier PITR is one of the two options considered
#10/#11 GDPR + T&C record	#35 lookup_customer enumeration (nice-to-have)	Different topic (data protection vs. rate-limiting) — not a duplicate, both are "customer data" adjacent

LG Pilates Booking System — Improvement Recommendations report. Compiled 6 Jul 2026. Report only — no product code changed. Recommendations become GitHub issues only after Mark reviews and picks winners.
